

September 28, 2011

The Ballasted system by American Precision Solar Rack is a pleasure to work with. The ease and simplicity of the system allowed our installers to complete the installation of our modules in a fraction of the time over many of the other racking manufactures out there; saving us much time and money on the job.

The fact that there are basically no nuts and bolts to assemble these racks allows a steady smooth flow in assembly. The use of pop-rivets is simplicity at its best.

It is also one of the lightest systems out there. This allows us to get systems on some roofs that normally wouldn't support it.

We look forward to using the American Precision Solar Rack system on as many installs as possible.

Sincerely

Shimmy Tessler
